Vanilla autoencoder

► $\|f(g(x)) - x\| \rightarrow 0$

Use cases

- ▶ unsupervised learning of first layers
- ▶ dimension reduction
- ▶ generation of new content
- ▶ not used for data encoding!

Denoising autoencoder

- ▶ $\|f(g(x')) - x\| \rightarrow 0$
- ▶ $x' = x + \text{Norm}(0, 1)$

Sparse autoencoder

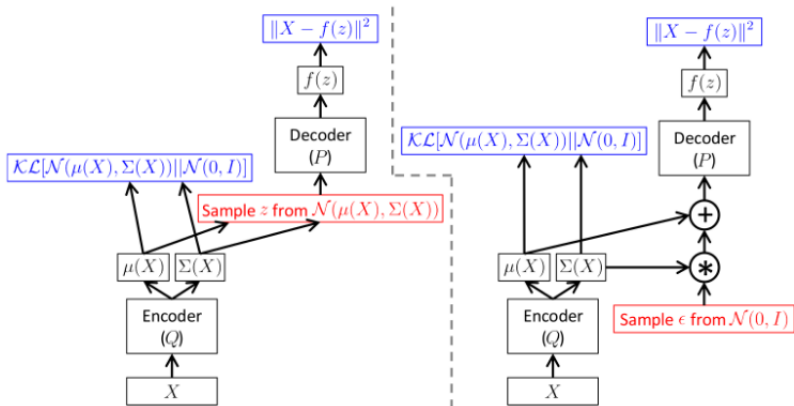

- ▶ $\|f(g(x)) - x\| + \Omega(h) \rightarrow 0$
- ▶ $h = g(x)$ - embedding (code)

Variational autoencoder

- ▶ Tutorial on Variational Autoencoders
- ▶ other tutorial from habr
